CLAIMS

- 1 A method for a file server to allocate a spare disk to replace a failed disk in a net-
- work storage system comprising the steps of:
- identifying a set of spare disks;
- choosing a best spare disk of the set of spare disks; and
- 5 claiming ownership of the best spare disk.
- 1 2. The method of claim 1 further comprising the steps of:
- choosing, in response to a failure of the step of claiming ownership, a next best
- 3 spare disk of the spare disks available; and
- claiming ownership of the next best spare disk.
- 1 3. The method of claim 2, wherein the step of claiming ownership of the best spare
- disk further comprises the steps of:
- setting a first ownership attribute to a file server-owned state; and
- setting a second ownership attribute to a file server-owned state
- 1 4. The method of claim 1 wherein the step of choosing the best spare disk further
- 2 comprises the steps of:
- selecting one or more disks from the set of spare disks that satisfy one or more
- 4 rules;

1

- sorting the one or more disks selected from the set of spare disks according to a
- 6 set of ordered policies to identify a highest-ranked disk;
- 7 choosing a highest-ranked disk as the best spare disk; and
- choosing, in response to more than one of the one or more disks being highest-
- 9 ranked, one disk at random, from the more than one of the one or more disks that are
- highest-ranked, as the best spare disk.

- 1 5. A method of verifying that a plurality of disks in a volume are optimally config-
- 2 ured comprising the steps of:
- identifying all of the disks in the volume;
- obtaining disk characteristics, respectfully, from all of the disks in the volume;
- 5 comparing the disk characteristics with a set of policies and characteristics of
- 6 spare disks; and
- alerting an administrator if a more optimal configuration is possible.
- 1 6. The method of claim 5 further comprising the step of:
- reconfiguring the disks into a more optimal configuration.
- 7. A method of selecting a best spare disk for use by a file server serving an array of
- disks from a set of spare disks comprising the steps of:
- selecting one or more disks from the set of spare disks that satisfy one or more
- 4 rules;

1

- sorting the one or more disks using a set of ordered policies;
- if only one disk is highest-ranked, selecting the one disk that is highest-ranked as
- 7 the best spare disk; and
- if a plurality of disks are highest-ranked, selecting one disks from the plurality of
- 9 disks that are highest ranks as the best spare disk.
 - 8. A network storage system comprising:
- one or more switches;
- a plurality of spare disks operatively interconnected through at least one of the
- 4 switches; and
- one or more file servers operatively interconnected to at least one of the switches,
- each of the file servers including means for allocating one of the plurality of spare disks.
 - 9. The network storage system of claim 8, wherein the means for allocating one or
- 2 more of the plurality of spare disks further comprises:

- means for identifying the plurality of spare disks;
- means for selecting a best spare disk from the plurality of spare disks; and
- 5 means for claiming ownership of the best spare disk.
- 1 10. The network storage system of claim 9, wherein the means for selecting a best spare
- disk from the plurality of spare disks further comprises:
- means for selecting a set of disks from the plurality of spare disks that satisfy one or
- 4 more rules;
- means for sorting the set of disks according to a set of ordered policies; and
- 6 means for selecting a highest-ranked disk from the set of disks.
- 1 11. A computer-readable medium, including program instructions executing on a file
- server, for allocating a replacement disk to the file server, the program instructions per
 - forming the steps of:
- identifying a set of spare disks;
- choosing a best spare disk of the set of spare disks; and
- 6 claiming ownership of the best spare disk.
- 1 12. The computer-readable medium of claim 11, wherein the step of choosing the best
- spare disk further comprises the steps of:
- selecting one or more disks from a set of spare disks that satisfy one or more
- 4 rules;

3

- sorting the one or more disks selected from the set of spare disks according to a
- 6 set of ordered policies to identify a highest-ranked disk;
- 7 choosing a highest-ranked disk as the best spare disk; and
- choosing, in response to more than one of the one or more disks being highest-
- ranked, one disk at random, from the more than one of the one or more disks that are
- highest-ranked, as the best spare disk.
